What are image edges?

grayscale image

$f(\mathbf{x})$

Very sharp discontinuities in intensity.

domain $\mathbf{x} = \begin{bmatrix} x \\ y \end{bmatrix}$

Detecting edges

How would you go about detecting edges in an image (i.e., discontinuities in a function)?

Detecting edges

How would you go about detecting edges in an image (i.e., discontinuities in a function)?

- ✓ You take derivatives: derivatives are large at discontinuities.

How do you differentiate a discrete image (or any other discrete signal)?

Detecting edges

How would you go about detecting edges in an image (i.e., discontinuities in a function)?

- ✓ You take derivatives: derivatives are large at discontinuities.

How do you differentiate a discrete image (or any other discrete signal)?

- ✓ You use finite differences.

Finite differences

High-school reminder: definition of a derivative using forward difference

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

Finite differences

High-school reminder: definition of a derivative using forward difference

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

Alternative: use central difference

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+0.5h) - f(x-0.5h)}{h}$$

For discrete signals: Remove limit and set $h = 2$

$$f'(x) = \frac{f(x+1) - f(x-1)}{2}$$

What convolution kernel does this correspond to?

Finite differences

High-school reminder: definition of a derivative using forward difference

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

Alternative: use central difference

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+0.5h) - f(x-0.5h)}{h}$$

For discrete signals: Remove limit and set $h = 2$

$$f'(x) = \frac{f(x+1) - f(x-1)}{2}$$

1D derivative filter

which Sobel filter?

which Sobel filter?

Computing image gradients

1. Select your favorite derivative filters.

$$\mathbf{S}_x = \begin{array}{|c|c|c|} \hline 1 & 0 & -1 \\ \hline 2 & 0 & -2 \\ \hline 1 & 0 & -1 \\ \hline \end{array}$$

$$\mathbf{S}_y = \begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline 0 & 0 & 0 \\ \hline -1 & -2 & -1 \\ \hline \end{array}$$

Computing image gradients

1. Select your favorite derivative filters.

$$\mathbf{S}_x = \begin{array}{|c|c|c|} \hline 1 & 0 & -1 \\ \hline 2 & 0 & -2 \\ \hline 1 & 0 & -1 \\ \hline \end{array}$$

$$\mathbf{S}_y = \begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline 0 & 0 & 0 \\ \hline -1 & -2 & -1 \\ \hline \end{array}$$

2. Convolve with the image to compute derivatives.

$$\frac{\partial f}{\partial x} = \mathbf{S}_x \otimes f$$

$$\frac{\partial f}{\partial y} = \mathbf{S}_y \otimes f$$

Computing image gradients

1. Select your favorite derivative filters.

$$\mathbf{S}_x = \begin{array}{|c|c|c|} \hline 1 & 0 & -1 \\ \hline 2 & 0 & -2 \\ \hline 1 & 0 & -1 \\ \hline \end{array}$$

$$\mathbf{S}_y = \begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline 0 & 0 & 0 \\ \hline -1 & -2 & -1 \\ \hline \end{array}$$

2. Convolve with the image to compute derivatives.

$$\frac{\partial f}{\partial x} = \mathbf{S}_x \otimes f$$

$$\frac{\partial f}{\partial y} = \mathbf{S}_y \otimes f$$

3. Form the image gradient, and compute its direction and amplitude.

$$\nabla f = \left[\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y} \right]$$

gradient

$$\theta = \tan^{-1} \left(\frac{\partial f}{\partial y} / \frac{\partial f}{\partial x} \right)$$

direction

$$\|\nabla f\| = \sqrt{\left(\frac{\partial f}{\partial x} \right)^2 + \left(\frac{\partial f}{\partial y} \right)^2}$$

amplitude

How does the gradient direction relate to these edges?

How do you find the edge of this signal?

intensity plot

How do you find the edge of this signal?

intensity plot

Using a derivative filter:

derivative plot

What's the problem here?

Differentiation is very sensitive to noise

When using derivative filters, it is critical to blur first!

How much should we blur?

Derivative of Gaussian (DoG) filter

Derivative theorem of convolution: $\frac{\partial}{\partial x}(h \star f) = (\frac{\partial}{\partial x}h) \star f$

input

derivative of
Gaussian

output (same
as before)

- How many operations did we save?

Tradeoff between smoothing and localization

1 pixel

3 pixels

7 pixels

- Smoothed derivative removes noise, but blurs edge. Also finds edges at different “scales”.

Laplace filter

Basically a second derivative filter.

- We can use finite differences to derive it, as with first derivative filter.

first-order
finite difference

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x + 0.5h) - f(x - 0.5h)}{h}$$

→

1D derivative filter

1	0	-1
---	---	----

second-order
finite difference

$$f''(x) = \lim_{h \rightarrow 0} \frac{f(x + h) - 2f(x) + f(x - h)}{h^2}$$

→

Laplace filter
?

Laplace filter

Basically a second derivative filter.

- We can use finite differences to derive it, as with first derivative filter.

first-order
finite difference

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x + 0.5h) - f(x - 0.5h)}{h}$$

Laplacian of Gaussian filtering

Derivative of Gaussian filtering

Zero crossings are more accurate at localizing edges (but not very convenient).

But Wait ... Is Pixel Difference the Final Answer?

Where do humans see boundaries?

image

human segmentation

gradient magnitude

- Berkeley segmentation database:
<http://www.eecs.berkeley.edu/Research/Projects/CS/vision/grouping/segbench/>

Score = confidence of edge.
For humans, this is averaged across
multiple participants.

Score = confidence of edge.
For humans, this is averaged across
multiple participants.

Canny Edge Detector

- Arguably **the most widely used** edge detector in computer vision
- Theoretical model: step-edges corrupted by additive Gaussian noise

Canny edge detector

1. Filter image with x, y derivatives of Gaussian

Derivative of Gaussian filter

x-direction

y-direction

Compute Gradients

X Derivative of Gaussian

Y Derivative of Gaussian

(x2 + 0.5 for visualization)

Canny edge detector

1. Filter image with x, y derivatives of Gaussian
2. Find magnitude and orientation of gradient

Compute Gradient Magnitude

$$\text{sqrt}(\text{XDerivOfGaussian} .^2 + \text{YDerivOfGaussian} .^2) = \text{gradient magnitude}$$

Compute Gradient Orientation

- Threshold magnitude at minimum level
- Get orientation via $\theta = \text{atan2}(y\text{Deriv}, x\text{Deriv})$

Canny edge detector

1. Filter image with x, y derivatives of Gaussian
2. Find magnitude and orientation of gradient
3. Non-maximum suppression:
 - Thin multi-pixel wide “ridges” to single pixel width

Non-maximum suppression for each orientation

At pixel q:
We have a maximum if the value is larger than those at both p and at r.

Interpolate along gradient direction to get these values.

Before Non-max Suppression

Gradient magnitude (x4 for visualization)

After non-max suppression

Gradient magnitude (x4 for visualization)

Canny edge detector

1. Filter image with x, y derivatives of Gaussian
2. Find magnitude and orientation of gradient
3. Non-maximum suppression:
 - Thin multi-pixel wide “ridges” to single pixel width
4. ‘Hysteresis’ Thresholding

'Hysteresis' Thresholding

- Two thresholds – high and low
- Grad. mag. $>$ high threshold? = strong edge
- Grad. mag. $<$ low threshold? noise
- In between = weak edge
- **Edge linking:** 'Follow' edges starting from strong edge pixels
- Continue them into weak edges
 - Connected components

Final Canny Edges

$$\sigma = \sqrt{2}, t_{low} = 0.05, t_{high} = 0.1$$

Effect of σ (Gaussian kernel spread/size)

Original

$$\sigma = \sqrt{2}$$

$$\sigma = 4\sqrt{2}$$

The choice of σ depends on desired behavior

- large σ detects large scale edges
- small σ detects fine features

Canny edge detector

1. Filter image with x, y derivatives of Gaussian
2. Find magnitude and orientation of gradient
3. Non-maximum suppression:
 - Thin multi-pixel wide “ridges” to single pixel width
4. ‘Hysteresis’ Thresholding:
 - Define two thresholds: low and high
 - Use the high threshold to start edge curves and the low threshold to continue them
 - ‘Follow’ edges starting from strong edge pixels
 - Connected components (Szeliski 3.3.4)

Python: e.g., `skimage.feature.canny()`
